Background information

A 90-day vapor space corrosion rate study was conducted using **GeoBrom® HG520** calcium bromide solution and six selected metals at 20° and 50°C. ASTM Method “Standard Practice for Preparing, Cleaning, and Evaluating Corrosion Test Specimens” G1–03 (reapproved 2011) was used to prepare, clean, and evaluate tests specimens.

The following six metals were evaluated:

- **C-1018** mild carbon steel coupon
- **304-W** 304SS welded coupon
- **316-LW** 316SS, low carbon, welded coupon
- **2205** Duplex 2205 coupon
- **304-LW** 304SS, low carbon, welded coupon
- **316** 316SS coupon

Objectives of the study

- Establish subsurface corrosion rates at 20°C and 50°C for each metal.
- Visually document coupon condition before and after 90 day exposure.

All specimens were less than 0.06 mpy corrosion rate based on this 90-day study. Mild carbon steel (C-1018) gave the highest rates at 0.025 mpy at 20°C and 0.053 mpy at 50°C. All remaining specimens were under 0.015 mpy. Minor surface corrosion was observed on both C1018 coupons. There was no visible corrosion on remaining test specimens, and all test solutions remained water clear after 90 days. The maximum allowable corrosion rate for each specimen with GeoBrom® HG520 depends on the application.

Description of test procedure

Metal test coupons with dimensions of ~2.0" x 0.75" x 0.125" were supplied by an outside vendor. The vendor prepared the coupons by abrading surfaces and stamping metal type and marking specimens with a unique identification number. Prior to using, coupons were cleaned using reagent grade aqueous HCl and a bristle brush followed by a thorough deionized water rinse, degreased using acetone, dried using hot air, then allowed to cool in desiccators. The clean, dry specimens were weighed and measured. Using forceps, a four place OHAUS Galaxy Model G160D analytical balance was used to attain initial weights for all coupons. Dimensions were established using a Starrett® Micrometer part # 436RL-1, EDP 51568 and a Starrett® Dial Caliper Part # 120Z, EDP 55951. Three measurements were taken on all dimensions and averaged for the length, width, and thickness. Pictures were taken to record coupon condition prior to vapor exposure tests.

Test coupons were split into two groups, containing specimens of each metal type, and placed into individual 4-oz bottles with Teflon® liners. Coupons were suspended 3/8 inches above the liquid surface using Teflon® string. One group was placed in a Yamato Model DVS600 drying oven to hold samples at 50°C and the second group placed in a controlled environment room held at 20°C. There was no agitation or aeration of the test specimens while in the glass bottles.

Duration of the test was 90 days and 1 hour or 2,161 hours. Prior to cleaning, pictures were taken to record coupon condition after the 90 day immersion test. After cleaning, pictures were taken again. None of the specimens were heavily corroded, so post immersion cleaning was simple and consisted of the following:

- Immersion in deionized water to remove test solution
- Immersion and brushed in aq. HCl (for mild carbon steel), and nitric acid (for the stainless steels)
- Thoroughly rinsed with deionized water, then immediately dried. The C1018 coupon required light scrubbing using a brush in deionized water. Table A1.1 in ASTM G1-03 was used as a guide to select cleaning procedure for removal of corrosion products. After drying test specimens with hot air and then allowing them to cool in desiccators, all specimens were re-weighed and the final weights recorded

Spreadsheets were developed to capture data and to make calculations per ASTM method. Calculated metal densities and published metal densities were used in corrosion rate calculations for comparison.

The average corrosion rate calculation per ASTM G1-03 is:

Corrosion rate = (K x W) / (A x T x D)

- K = a constant "(K) constant listed in ASTM G1-03, Section 8 for desired units"
- T = time of exposure in hours
- A = area in cm²
- W = mass loss in grams
- D = density in gm/cm³

Results and discussion

Tables 1 and 2 provide data on test specimens at 20°C and at 50°C, respectively. Corrosion rates on all specimens were under 0.10 mpy rate. Mild carbon steel C-1018 gave the highest corrosion rate at 0.025 mpy at 20°C and 0.053 mpy at 50°C. Minor surface corrosion but no pitting was observed on C-1018 coupons. There was no surface corrosion or pitting observed on any remaining specimens suspended above the liquid by ~ 3/8 inches. C-1018 corrosion is likely due to humidity in headspace of bottle.

Corrosion rates for each specimen were charted to reflect trends over the two temperatures 20°C and 50°C (see Figure 1).

GeoBrom® HG520 test solutions were saved for Inductively Coupled Plasma (ICP) analysis before and after the immersion tests. After the 90-day period, all GeoBrom® HG520 solutions remained water clear. To verify that there was no significant increase in any metals after 90 days, ICP analysis was conducted only on GeoBrom® HG520 used for the C-1018 coupon, since the C-1018 coupon had the highest corrosion rate after 90 days at 50°C. See Table 4 for metals concentrations in test fluid at start, at end, and the difference. Data verified that there is little to no increase in metals. All bottles were sealed, but a small amount of water vapor may have vented over 90 days resulting in a slight increase in metals.

To visually document condition of test specimens, pictures were taken before and after immersion tests (see Figures 2–6).

Conclusion

C-1018 showed signs of a slight surface corrosion in this test and a low corrosion rate. There are a number of different corrosion standards depending on the application. Therefore, whether C-1018 is suitable for use with CaBr₂ depends on the application. These data are relevant only to the 52% CaBr₂ solution. Dilute solutions or other uses of 52% solution may exhibit different corrosive behaviors.

The manner in which you use and the purpose to which you put and utilize our products, technical assistance and information (whether verbal, written or by way of production evaluations), including any suggested formulations and recommendations are beyond our control. Therefore, it is imperative that you test our products, technical assistance and information to determine to your own satisfaction whether they are suitable for your intended uses and applications. This application-specific analysis must at least include testing to determine suitability from a technical as well as health, safety, and environmental standpoint. Such testing has not necessarily been done by us. Unless we otherwise agree in writing, all products are sold strictly pursuant to the terms of our standard conditions of sale. All information and technical assistance is given without warranty or guarantee and is subject to change without notice. It is expressly understood and agreed that you assume and hereby expressly release us from all liability, in tort, contract or otherwise, incurred in connection with the use of our products, technical assistance, and information. Any statement or recommendation not contained herein is unauthorized and shall not bind us. Nothing herein shall be construed as a recommendation to use any product in conflict with patents covering any material or its use. No license is implied or in fact granted under the claims of any patent.

Health and Safety Information: Appropriate literature has been assembled which provides information concerning the health and safety precautions that must be observed when handling the LANXESS products mentioned in this publication. For materials mentioned which are not LANXESS products, appropriate industrial hygiene and other safety precautions recommended by their manufacturers should be followed. Before working with any of these products, you must read and become familiar with the available information on their hazards, proper use, and handling. This cannot be overemphasized. Information is available in several forms, e.g., material safety data sheets and product labels. Consult your LANXESS Solutions US Inc. representative or contact the Product Safety and Regulatory Affairs Department at LANXESS.

Regulatory Compliance Information: Some of the end uses of the products described in this publication must comply with applicable regulations, such as the FDA, NSF, USDA, CPSC and BfR. If you have any questions on the regulatory status of these products, contact your LANXESS Solutions US Inc. representative or Regulatory Affairs Manager at LANXESS.

Note: The information contained in this publication is current as of June, 2018. Please contact LANXESS Solutions US Inc. to determine if this publication has been revised.
